Managed Services without modifying your network.

Why isn't your File Server responding? Is your website working? Where did your Domain Controller go? Has the latest Security Patch been applied to all of your employees' machines?

Ask the Onsite Manager. This electronic US itek field agent monitors your network and systems to identify existing and potential problems. The Onsite Manager regularly reports back to the US itek Control Center, alerting US itek technicians immediately when services are lost or equipment fails and providing an all inclusive dashboard where you can see the current state, existing issues and action being taken to resolve them.

Just patch it in and power it up. Point it in the right direction and the Onsite Manager leaps into action, exploring and identifying Servers, Clients and Network devices (Routers, Switches, Printers).

The quality Entura-based configuration in a Sleek Slim black chassis was designed and manufactured by US itek exclusively for the Onsite Manager. Powered by Intel, this application specific design provides all of the speed at a much lower cost. With 512MB of DDR memory (expandable to 2GB) and running on Windows XP w/Service Pack 2, this machine guarantees performance of Onsite Manager and delivers full Control Center functionality

The 100MBPS Ethernet Port provides smooth, dataflow and we've included USB 2.0 Support for easy Maintenance. Preloaded and Preconfigured for easy installation and immediate use, the Onsite Manager also provides a ready made home for diagnostic, repair and recovery tools and is insured by US itek's 24-month Easy Exchange Warranty.

Dedication makes all the difference!

- Dedicated system means less chance for conflict and failure
- No changes to your current Server, Network or Client configuration
- Updates/modifications to monitoring can be made without affecting the rest of the network or other servers.
- Connection capabilities remain intact providing access to restore lost servers
- Replacement servers immediately available
- Pre-hardened to prevent outside or unauthorized access
- Outbound-only traffic lessens network exposure
- Dedicated Service ID for access auditing requirements
